Scenario: A fictional campus security project

Riverside College is a fictional institution with 1,200 students and 85 staff members. The college plans to improve cybersecurity after staff reported several suspicious emails and one attempted account takeover. No personal records were lost during the incident.

Main objectives

The project has three priorities: protect student and staff accounts, reduce phishing risks, and improve incident reporting. The IT team will introduce multi-factor authentication (MFA) for all staff accounts, provide phishing-awareness training, and create a single reporting email address: security@riverside.example.

Implementation schedule

Phase 1, in January 2027, covers staff training and a review of account permissions. Phase 2, in February 2027, introduces MFA and tests account recovery procedures. Phase 3, in March 2027, runs a simulated phishing exercise and evaluates the results.

How success will be measured

The college aims for 95% of staff to enable MFA by the end of February 2027. It also wants at least 90% of staff to complete training, and it aims to reduce clicks on simulated phishing emails below 10% by the end of March 2027. The IT manager will review progress every two weeks.

Important response procedure

Staff who receive a suspicious message must not open attachments or enter passwords using links in the message. They should report the email to the IT team. If an account may be compromised, the IT team should disable suspicious sessions, reset credentials, investigate sign-in records, and document the incident.

This document is entirely fictional and contains no real account credentials.
